Internship Report

Solal Rapaport

June 2022

1 Introduction

The goal is to build formulas that will allow robots, spread on a ring, to gather. We have k robots and we will use view vectors to build those formulas. The formulas will be an interpretation of the pseudo-code given in the research report [1].

The formulas we are building, will be used with formulas given in an other research report [2], and then will be tested in the acceleration algorithm using an interpolant [2]

2 Configuration with single multiplicity

The strategy ϕ_{SM} is *true* if the given configuration has a single multiplicity and that the robot calling the strategy should move toward the robot at distance d_0 :

$$\begin{gathered}\phi_{SM}(d_0,\ldots,d_{k-1}) := \\ (\bigvee_{i=0}^{k-1}(d_i = 0 \bigwedge_{j=0\ j\neq i}^{k-1}(d_j > 0 \vee (d_j = 0 \wedge d_{j-1} = 0))))\wedge \\ (d_{k-1} \neq 0)\wedge \\ ((d_1 = 0 \wedge d_{k-2} = 0 \wedge d_0 \leq d_{k-1}) \vee (d_1 = 0 \wedge d_{k-2} \neq 0))\end{gathered}$$

In order to test our strategy we need a function that will initialize our first configuration and make it one with a single multiplicity without being already a winning one. Here is its implementation in python :

```
def InitSM(p, s, t, taille_anneau):
    """
    Initialize the given configuration
    The configuration will have no multiplicity
    and won't be a winning one
    """
    tmpOr = []
    tmpAnd = []
    for i in range(len(p)):
        tmpOr.append(p[i] != p[(i+1)%len(p)])
    tmpAnd.append(Or(tmpOr))
    # we make sure there is no winning configuration
    # as a result of this function
    tmpOr = []
    for i in range(len(s)):
        tmpAnd.append(p[i] >= 0)
        tmpAnd.append(p[i] < taille_anneau)
        tmpAnd.append(s[i] == -1)
        tmpAnd.append(t[i] == 0)

    for i in range(len(p)):
        tmpAndbis = []
        tmpAndbis.append(p[i] == p[(i+1)%len(p)])
        tmpOrbis = []
        for j in range(len(p)):
```

```
                if((j != i) and (j != (i+1))):
                    tmpOrbis.append(p[j] == p[i])
                    tmpAndter=[]
                    for h in range(len(p)):
                        if h !=j:
                            tmpAndter.append(p[h] != p[j])
                    tmpOrbis.append(And(tmpAndter))
            tmpAndbis.append(Or(tmpOrbis))
            tmpOr.append(And(tmpAndbis))
        tmpAnd.append(Or(tmpOr))
        return And(tmpAnd)
```

We want to test this function, we choose a configuration with a ring of size 5 and 3 robots. We use the parameters below as an input :

```
taille_anneau = 5          # Taille de l'anneau
nb_robots = 3              # Nombre de robot sur l'anneau

p = [ Int('p%s' % i) for i in range(nb_robots) ]
s = [ Int('s%s' % i) for i in range(nb_robots) ]
t = [ Int('t%s' % i) for i in range(nb_robots) ]

tabInit = InitSM(p, s, t, taille_anneau)
print("tabInit :\n", tabInit)

solv1 = Solver()
solv1.add(tabInit)

print("solv1 : ",solv1.check())
if(solv1.check() == sat):
    print("model :\n",solv1.model())
```

The code above produces the following output :

```
tabInit :
 And(Or(p0 != p1, p1 != p2, p2 != p0),
    p0 >= 0,
    p0 < 5,
    s0 == -1,
    t0 == 0,
    p1 >= 0,
    p1 < 5,
    s1 == -1,
    t1 == 0,
    p2 >= 0,
    p2 < 5,
    s2 == -1,
    t2 == 0,
    Or(And(p0 == p1, Or(p2 == p0, And(p0 != p2, p1 != p2))),
       And(p1 == p2, Or(p0 == p1, And(p1 != p0, p2 != p0))),
       And(p2 == p0,
           Or(p0 == p2,
              And(p1 != p0, p2 != p0),
              p1 == p2,
              And(p0 != p1, p2 != p1)))))
solv1 :  sat
model :
 [p1 = 1,
 p0 = 0,
 p2 = 0,
```

```
 t2 = 0,
 s2 = -1,
 t1 = 0,
 s1 = -1,
 t0 = 0,
 s0 = -1]
```

What the model shows us is a configuration where robots 0 and 2 are in position 0 and robot 1 is in position 1.

Now we implement in python the ϕ_{SM} strategy :

```
def phiSM(distances):
    tabAnd = []
    tabOr = []
    for i in range(len(distances)):
        tabAndBis = []
        tabAndBis.append(distances[i] == 0)
        for j in range(len(distances)):
            if j != i:
                tabOrBis.append(distances[j] > 0)
                tabOrBis.append(And(distances[j] == 0,
                    distances[j-1] == 0))
                tabAndBis.append(Or(tabOrBis))
        tabOr.append(And(tabAndBis))
    tabAnd.append(Or(tabOr))
    tabAnd.append(distances[-1] != 0)
    tabOr = []
    tabOr.append(And(distances[1] == 0, distances[-2] == 0,
        distances[0] <= distances[-1]))
    tabOr.append(And(distances[1] == 0, distances[-2] != 0))
    tabAnd.append(Or(tabOr))
    return And(tabAnd)
```

We test this function in the same configuration than given before with the following input :

```
taille_anneau = 5        # Taille de l'anneau
nb_robots = 3            # Nombre de robot sur l'anneau

p = [ Int('p%s' % i) for i in range(nb_robots) ]
s = [ Int('s%s' % i) for i in range(nb_robots) ]
t = [ Int('t%s' % i) for i in range(nb_robots) ]

d0 = [ Int('d%s' % i) for i in range(nb_robots) ]
d1 = [ Int('d%s' % i) for i in range(nb_robots) ]
d2 = [ Int('d%s' % i) for i in range(nb_robots) ]

tabInit = InitSM(p, s, t, taille_anneau)
tabConfig1 = ConfigView(taille_anneau, nb_robots, 0, p, d0)
tabConfig2 = ConfigView(taille_anneau, nb_robots, 1, p, d1)
tabConfig3 = ConfigView(taille_anneau, nb_robots, 2, p, d2)
tabPhiSM1 = phiSM(d0)
tabPhiSM2 = phiSM(d1)
tabPhiSM3 = phiSM(d2)

solv1 = Solver()
solv1.add(tabInit)
solv1.add(tabConfig1)
solv1.add(tabPhiSM1)
```

```
print("solv1 : ",solv1.check())
if(solv1.check() == sat):
        print("model :\n",solv1.model())

solv2 = Solver()
solv2.add(tabInit)
solv2.add(tabConfig2)
solv2.add(tabPhiSM2)

print("solv2 : ",solv2.check())
if(solv2.check() == sat):
        print("model :\n",solv2.model())

solv3 = Solver()
solv3.add(tabInit)
solv3.add(tabConfig3)
solv3.add(tabPhiSM3)

print("solv3 : ",solv3.check())
if(solv3.check() == sat):
        print("model :\n",solv3.model())
```

It produces the following output :

```
solv1 :  sat
model :
 [d0 = 1,
 d2 = 4,
 p1 = 1,
 p0 = 0,
 p2 = 1,
 d1 = 0,
 t2 = 0,
 s2 = -1,
 t1 = 0,
 s1 = -1,
 t0 = 0,
 s0 = -1]
solv2 :  sat
model :
 [d0 = 1,
 d2 = 4,
 p1 = 0,
 p0 = 1,
 p2 = 1,
 d1 = 0,
 t2 = 0,
 s2 = -1,
 t1 = 0,
 s1 = -1,
 t0 = 0,
 s0 = -1]
solv3 :  sat
model :
 [d0 = 1,
 d2 = 4,
 p1 = 0,
 p0 = 0,
 p2 = 4,
```

$$
\begin{aligned}
&\mathrm{d1} = 0,\\
&\mathrm{t2} = 0,\\
&\mathrm{s2} = -1,\\
&\mathrm{t1} = 0,\\
&\mathrm{s1} = -1,\\
&\mathrm{t0} = 0,\\
&\mathrm{s0} = -1]
\end{aligned}
$$

What it shows us is that every robot can move in this kind of configuration. The solver find a way to place the robot calling the strategy outside of the multiplicity and then allow the strategy to be true, meaning, the robot moves toward the multiplicity.

3 Gathering rigid configurations

Let d_{ij} be the value j of the view vector of the robot i, and ds_{ij} the value j of the symmetrical view of the robot i. The robot is calling the strategy ϕ_R, here are all the logic formulas used in order to build ϕ_R:

AllView is *true* if $d_{00}, \dots, d_{k-1k-1}$ are all the views you can obtain from a single view vector $dist_0, \dots, dist_{k-1}$:

$$
\begin{gathered}
AllView(dist_0, \dots, dist_{k-1}, d_{00}, \dots, d_{k-1k-1}) :=\\
(\bigwedge_{i=0}^{k-1}(\bigwedge_{j=0}^{k-1}(d_{ij} = dist_{(j+i) \mod k})))
\end{gathered}
$$

IsRigid is *true* if the given configuration is a rigid configuration. Meaning, all the views are distinct, and so there is no multiplicity, the configuration isn't symmetric or periodic.

$$
\begin{gathered}
IsRigid(d_{00}, \dots, d_{k-1k-1}, ds_{00}, \dots, ds_{k-1k-1}) :=\\
\bigwedge_{i=0}^{k-1}(\bigwedge_{j=0}^{k-1} d_{ij} \neq 0) \wedge\\
\bigwedge_{i=0}^{k-1}(\bigwedge_{l=0\ l\neq i}^{k-1}((\bigvee_{j=0}^{k-1} d_{ij} \neq d_{lj}) \wedge (\bigvee_{j=0}^{k-1} d_{ij} \neq ds_{lj})\\
\wedge(\bigvee_{j=0}^{k-1} ds_{ij} \neq d_{lj}) \wedge (\bigvee_{j=0}^{k-1} ds_{ij} \neq ds_{lj})))
\end{gathered}
$$

AllCode is *true* if (α'_r, β'_r) is the set of two natural numbers of the robot r such as α'_r and β'_r are codes of r's views, with $\alpha'_r < \beta'_r$.

$$
\begin{gathered}
AllCode(d_{00}, \dots, d_{k-1k-1}, ds_{00}, \dots, ds_{k-1k-1}, \alpha_0, \dots, \alpha_{k-1}, \beta_0, \dots, \beta_{k-1},\\
\alpha'_0, \dots, \alpha'_{k-1}, \beta'_0, \dots, \beta'_{k-1}) :=\\
\bigwedge_{i=0}^{k-1}(\alpha'_i < \beta'_i \wedge (\alpha'_i = \alpha_i \vee \alpha'_i = \beta_i) \wedge (\beta'_i = \alpha_i \vee \beta'_i = \beta_i)) \wedge\\
(\ (\alpha_0 < \alpha_1 < \dots < \alpha_{k-1} < \beta_0 < \dots < \beta_{k-1}) \wedge\\
(\bigvee_{p=0}^{k-1}(\bigwedge_{q=0}^{p-1}(d_{0q} = d_{1q}) \wedge d_{0p} > d_{1p})) \wedge \dots \wedge\\
(\bigvee_{p=0}^{k-1}(\bigwedge_{q=0}^{p-1}(ds_{(k-2)q} = ds_{(k-1)q}) \wedge ds_{(k-2)p} > ds_{(k-1)p}))\\
\vee\\
((\alpha_0 < \alpha_2 < \alpha_1 < \dots < \alpha_{k-1} < \beta_0 < \dots < \beta_{k-1}) \wedge \dots) \vee \dots\ )
\end{gathered}
$$

CodeMaker is *true* if the configuration is rigid and if $(a_0, \dots, a_{k-1}, as_0, \dots, as_{k-1})$ are each code of each view passed as a parameter :

$$
\begin{gathered}
CodeMaker(d_{00}, \dots, d_{k-1k-1}, ds_{00}, \dots, ds_{k-1k-1}, a_0, \dots, a_{k-1}) :=\\
IsRigid(d_{00}, \dots, d_{k-1k-1}, ds_{00}, \dots, ds_{k-1k-1}) \wedge\\
\exists \alpha_0, \dots, \alpha_{k-1}, \beta_0, \dots, \beta_{k-1},\ \alpha'_0, \dots, \alpha'_{k-1}, \beta'_0, \dots, \beta'_{k-1},\\
AllCode(d_{00}, \dots, d_{k-1k-1}, ds_{00}, \dots, ds_{k-1k-1}, \alpha_0, \dots, \alpha_{k-1}, \beta_0, \dots, \beta_{k-1},\\
\alpha'_0, \dots, \alpha'_{k-1}, \beta'_0, \dots, \beta'_{k-1})\\
(\bigwedge_{i=0}^{k-1}(\bigwedge_{j=0, j\neq i}^{k-1}((a_i > a_j \wedge \alpha'_j > \alpha'_i) \vee (a_i < a_j \wedge \alpha'_j < \alpha'_i))))\\
\bigwedge_{i=0}^{k-1}(\bigwedge_{j=0, j\neq i}^{k-1} a_i \neq a_j)
\end{gathered}
$$

FindMax is *true* if Max is the highest value of the view vector passed as a parameter :

$$
\begin{gathered}
FindMax(dist_0, \dots, dist_{k-1}, Max) :=\\
(\bigwedge_{i=0}^{k-1}(Max \geq dist_i) \wedge (\bigvee_{i=0}^{k-1}(Max = dist_i)))
\end{gathered}
$$

$FindM$ is *true* if M is the index of the robot (index in the view vector) which has the largest code of view and a neighboring robot at distance Max :

$$\begin{gathered}FindM(d_{00},\dots,d_{k-1k-1},a_0,\dots,a_{k-1},Max,dM_0,\dots,dM_{k-1}) :=\\ \bigvee_{m=0}^{k-1}((\bigwedge_{i=0}^{k-1}((a_m \geq a_i \wedge (d_{i0}=Max \vee d_{ik-1}=Max))\\ \vee(d_{i0}<Max \wedge d_{ik-1}<Max))) \wedge M=m)\end{gathered}$$

$FindN$ is *true* if N is the index of the robot (index in the view vector) with the largest code of view and M as a neighboring robot at distance Max :

$$\begin{gathered}FindN(d_{00},\dots,d_{k-1k-1},a_0,\dots,a_{k-1},Max,M,N) :=\\ (d_{M0}=Max \wedge d_{Mk-1}=Max \wedge\\ ((N=((M+1) \mod k) \wedge a_{(M+1) \mod k} > a_{(M-1) \mod k}) \vee\\ (N=((M-1) \mod k) \wedge a_{(M-1) \mod k} > a_{(M+1) \mod k})))\\ \vee\\ (d_{M0}=Max \wedge d_{Mk-1} \neq Max \wedge N=((M+1) \mod k))\\ \vee\\ (d_{M0} \neq Max \wedge d_{Mk-1}=Max \wedge N=((M-1) \mod k))\end{gathered}$$

Since those formulas can't be implemented in python because it is impossible to work around a variable index, we choose to build a new formula, $FindMN$ that will be *true* if both vectors dM and dN are the view vector of, respectively, M and N.

$$\begin{gathered}FindMN(d_{00},\dots,d_{k-1k-1},a_0,\dots,a_{k-1},Max,M,N,\\ dM_0,\dots,dM_{k-1},dN_0,\dots,dN_{k-1}) :=\\ \bigvee_{m=0}^{k-1}(\quad (\bigwedge_{i=0}^{k-1}((a_m \geq a_i \wedge (d_{i0}=Max \vee d_{ik-1}=Max))\\ \vee(d_{i0}<Max \wedge d_{ik-1}<Max))) \wedge M=m \wedge\\ (\quad (d_{m0}=Max \wedge d_{mk-1}=Max \wedge\\ ((N=M+1 \mod k \wedge a_{(m+1) \mod k} > a_{(m-1) \mod k}) \vee\\ (N=M-1 \mod k \wedge a_{(m-1) \mod k} > a_{(m+1) \mod k})) \vee\\ (d_{m0}=Max \wedge d_{mk-1} \neq Max \wedge N=M+1 \mod k) \vee\\ (d_{m0} \neq Max \wedge d_{mk-1}=Max \wedge N=M-1 \mod k) \quad) \wedge\\ ((N=M-1 \mod k \wedge (\bigwedge_{l=0}^{k-1}(dN_l=d_{(m-1 \mod k)((k-1)-l)} \wedge dM_l=d_{ml}))) \vee\\ (N=M+1 \mod k \wedge (\bigwedge_{l=0}^{k-1}(dN_l=d_{(m+1 \mod k)l} \wedge dM_l=d_{m((k-1)-l)})))) \quad)\end{gathered}$$

ϕ_R is *true* if the robot can move toward a multiplicity. There must be only one multiplicity and the configuration must be rigid :

$$\begin{gathered}\phi_R(dist_0,\dots,dist_{k-1}) :=\\ \exists d_{00},\dots,d_{k-1k-1},\ AllView(dist_0,\dots,dist_{k-1},d_{00},\dots,d_{k-1k-1}) \wedge\\ \exists ds_{00},\dots,ds_{k-1k-1},\bigwedge_{i=0}^{k-1}(ViewSym(d_{i0},\dots,d_{ik-1},ds_{i0},\dots,ds_{ik-1})) \wedge\\ \exists Max,a_0,\dots,a_{k-1},dM_0,\dots,dM_{k-1},dN_0,\dots,dN_{k-1},\\ CodeMaker(d_{00},\dots,d_{k-1k-1},ds_{00},\dots,ds_{k-1k-1},a_0,\dots,a_{k-1}) \wedge\\ FindMax(dist_0,\dots,dist_{k-1},Max) \wedge\\ FindMN(d_{00},\dots,d_{k-1k-1},a_0,\dots,a_{k-1},Max,dM_0,\dots,dM_{k-1},dN_0,\dots,dN_{k-1}) \wedge\\ \exists dM2_0,\dots,dM2_{k-1},dN2_0,\dots,dN2_{k-1},\\ ((\bigwedge_{i=0}^{k-1}(dM2_i=dM_{i+1 \mod k})) \vee (\bigwedge_{i=0}^{k-1}(dM2_i=dM_{i-1 \mod k}))) \wedge\\ (\bigvee_{i=0}^{k-1}(dM2_i \neq dN_i)) \wedge\\ ((\bigwedge_{i=0}^{k-1}(dN2_i=dN_{i+1 \mod k})) \vee (\bigwedge_{i=0}^{k-1}(dN2_i=dN_{i-1 \mod k}))) \wedge\\ (\bigvee_{i=0}^{k-1}(dN2_i \neq dM_i)) \wedge\\ \exists distM_0,\dots,distM_{k-1},distN_0,\dots,distN_{k-1},\\ \bigwedge_{i=0}^{k-1}(distM_i=(\sum_{l=0}^{i}dM_l) \wedge distN_i=(\sum_{l=0}^{i}dN_l)) \wedge\\ (\bigvee_{i=0}^{k-1} \quad (\quad (distM_i<distN_i \bigwedge_{q=0}^{i}(distM_q=distN_q) \bigwedge_{j=0}^{k-1}(dM_j=dist_j)) \vee\\ (distM_i>distN_i \bigwedge_{q=0}^{i}(distM_q=distN_q) \bigwedge_{j=0}^{k-1}(dN_j=dist_j)) \quad) \quad)\end{gathered}$$

4 Gathering an odd number of robots

We are now building a strategy, ϕ_{ON}, that will gather an odd number of robots on a non-periodic configuration. It is the strategy with the lowest priority, it means that the configuration won't be rigid and won't have any multiplicity.

First we build the formula, $IsPeriodic$, that will return *true* if the configuration is periodic with an odd number of robots :

$$\begin{gathered} IsPeriodic(dist_0, \ldots, dist_{k-1}) := \\ \exists p \in [1; \lfloor \tfrac{k}{3} \rfloor], (p+1) \mod 2 = 0 \wedge \\ \exists d'_0, \ldots, d'_{p-1}, \bigwedge_{i=0}^{k-1} (d'_{i \mod p} = dist_i) \end{gathered}$$

Now, we build build the ϕ_{OD} strategy, it returns *true* if the configuration is non-rigid, non-periodic, has no multiplicity and has an odd number of robots. The robot just move in order to create a multiplicity or a rigid configuration that will lead to a rigid configuration or one with a multiplicity.

$$\begin{gathered} \phi_{ON}(dist_0, \ldots, dist_{k-1}) := \\ \exists d_{00}, \ldots, d_{k-1k-1}, \ AllView(dist_0, \ldots, dist_{k-1}, d_{00}, \ldots, d_{k-1k-1}) \wedge \\ \exists ds_{00}, \ldots, ds_{k-1k-1}, \bigwedge_{i=0}^{k-1} (ViewSym(d_{i0}, \ldots, d_{ik-1}, ds_{i0}, \ldots, ds_{ik-1})) \wedge \\ \neg IsRigid(d_{00}, \ldots, d_{k-1k-1}, ds_{00}, \ldots, ds_{k-1k-1}) \wedge \\ ((k+1) \mod 2 = 0) \wedge \\ \neg IsPeriodic(dist_0, \ldots, dist_{k-1}) \wedge \\ (\bigwedge_{i=0}^{k-1} dist_i \neq 0) \wedge \\ (\bigwedge_{i=0}^{k-1} dist_i = ds_{0i}) \end{gathered}$$

5 Tests

In order to test the algorithm [2] we will use the python code we show you at the beginning : $InitSM$ and $phiSM$.

We will use the SAT-solver to test different configurations. We will change the number of robots and the size of the ring from a test to an other.

5.1 Test $InitSM$

First, we test the function $InitSM$ alone : can we have an initial configuration with a single multiplicity with those parameters ?

nb-robot \size-ring	2	3	4	5	6
2	Unsat	Unsat	Unsat	Unsat	Unsat
3	Sat	Sat	Sat	Sat	Sat
4	Sat	Sat	Sat	Sat	Sat
5	Sat	Sat	Sat	Sat	Sat
6	Sat	Sat	Sat	Sat	Sat

The results make sense : we can't create a multiplicity with 2 robots which is not a winning configuration. Else, even on a ring size of 2 we can have a multiplicity on one spot and only one robot on the other spot.

5.2 Test ϕ_{SM}

Now we test ϕ_{SM} through the algorithm [2], we also use the function $InitSM$ that makes sure we have a single multiplicity at the beginning.

nb-robot \size-ring	2	3	4	5	6
3	Timeout	Timeout	Timeout	...	...
4	Timeout	...	...	...	...
5	...	...	...	...	...
6	...	...	...	...	...

Same test but with the function $Init$ instead.

nb-robot \size-ring	2	3	4	5	6
3	Timeout	Loose	Loose	Loose	...
4		...	...	...	...
5	...	...	...	...	...
6	...	...	...	...	...

For $nb_{robot} = 3$ and $size_{ring} = 2$ we face this problem :

```
